

October 19, 2026

Dear Enid High School Parent,

You are receiving this letter to inform you that the Garfield County Health Department has identified a student who has active tuberculosis (TB) and has been isolated.

Garfield County Health Department is currently identifying anyone who is at risk for exposure, this is called a contact investigation. IF your student is at risk for exposure you will be receiving a letter for testing Oct 19, 2026.

- Anyone can get TB germs; if someone with an active infection coughs, sneezes, or talks, they can spray TB germs into the air. People nearby can breathe in this air and might contract TB germs.
- TB bacteria are more likely to spread in indoor areas or other places with poor air circulation than in outdoor areas such as sporting events.
- **If you or your student is contacted for testing, it is very important to complete testing and, if recommended, treatment to prevent the development of active TB disease. This is the best way to prevent active TB disease.**
- Otherwise, there is no need to change your activities or routines.
